

Project Information

- **Group Number:** NO: 7
- **Project Title:** Petal & Stem - Florist Appointment System
- **Leader / Nominated Submitter:** K.K.P. Akalanka (Index: ICT24806)
- **Team Members:**
 - H.G. Dineth Vishwa (Index: ICT24830)
 - Y.M. Paronavithana (Index: ICT24899)
 - R.I.B. Sadeep Mihiran (Index: ICT24885)
 - W.M. Ravindu (Index: ICT24915)
 - K.K.P. Akalanka (Index: ICT24806)

Problem, Intended Users, & Project Summary

- **Problem:** Florist shops need a rapid, intuitive way to record customer bookings, track order statuses, and visualize busy days without the overhead of complex backend server configurations.
- **Intended Users:** Florist shop owners, internal staff, and customers booking services.

- **Project Summary:** A Single Page Application (SPA) built within a strict 60-minute deadline. The system utilizes a lightweight browser-based local storage database to power a booking form, a real-time list dashboard with status toggles, and an interactive visual calendar that highlights days with active orders.

Main Features & Technologies Used

- **Features:**
 - SPA tab navigation (no page reloads).
 - Dynamic booking form (Name, Phone, Address, Date, Time).
 - Visual Monthly Calendar with dynamic indicator dots for scheduled orders.
 - Day-specific detail view to inspect individual orders.
 - Real-time admin dashboard to update order statuses (Received, Preparing, Ready, Completed).
 - Automated toast notifications for user feedback.
- **Technologies:** HTML5, CSS3 (Flexbox/Grid), Vanilla JavaScript, Web Storage API (LocalStorage).

Prompts & Follow-Up Prompts Used

- *Prompt 1:* "act as a professional web developer we need to create an appointment system that needs to make and show appointments for a flower shop. It can be built within one hour as simply using HTML, CSS and JavaScript. The requirements need a calendar appointment booking form, database, notification, appointment details: name, telephone, address, time, booked time, ready time, can update status of order"
- *Prompt 2:* "I want to change this calendar that represents whole months {days that have order shows different colour} as one like this image. When I click the date it needs to show the order of that day. It gives a separate page. Tell me how to connect that after"
- *Prompt 3:* "how to connect these both pages"
- *Prompt 4:* "in here above page work as single file"
- *Prompt 5:* "is safe to delete before files"
- *Prompt 6:* "act as a prompt engineer. I need to give a prompt to an AI agent to improve this. In the form we need to add order details like order type [1. bouquet: wedding, funeral, birthday, valentine, graduation 2. decoration: wedding, birthday, katina ceremony 3. flower order [add some type of flowers]] special details in calendar. It clearly represents the day that has order"
- *Prompt 7:* Provided the documentation requirements and team member details.

- Prompt8:[Please update my existing single-file HTML/CSS/JS florist appointment system with the following feature enhancements.
- **1. Booking Form Enhancements** Add a dynamic, cascading selection system for the order type, plus a custom notes field:
 - **Primary Category Dropdown:** Create a main select input with three options: "Bouquet", "Decoration", and "Flower Order".
 - **Dynamic Sub-Category Dropdown:** Create a second select input that dynamically changes its options based on what is selected in the primary category:
 - If *Bouquet*: Show "Wedding", "Funeral", "Birthday", "Valentine", "Graduation".
 - If *Decoration*: Show "Wedding", "Birthday", "Katina Ceremony".
 - If *Flower Order*: Show specific flower types (e.g., "Roses", "Lilies", "Orchids", "Carnations", "Mixed Seasonal").
 - **Special Details:** Add a textarea labeled "Special Details" for custom requests.
 - Ensure these new data points are saved to the localStorage object and are clearly visible in both the Calendar's daily view and the List Dashboard.
- **2. Calendar Visual Improvements** Upgrade the calendar grid to make days with orders much more obvious at a glance:
 - Instead of just a small dot, change the background color of the entire date cell to a soft accent color (e.g., a light peach or pink) when a day contains orders.
 - Add a small, bold numerical badge inside the date cell displaying the exact number of orders scheduled for that day.
 - Ensure the CSS for the "active/selected" day state still contrasts clearly against the new "has orders" background color.
 - Please output the fully merged, single-file HTML code.
 -]

Prompt 9:[Please update my existing single-file HTML/CSS/JS Florist Appointment System to incorporate a new unified color theme and a central Home page. Provide the complete, updated single-file code when finished.

1. Unified Color Theme Implementation Completely replace the existing color variables in the CSS :root with the provided palette. Apply these consistently across all UI elements (navigation, forms, tables, calendar grid, and notifications) ensuring good text contrast:

- **Main Background (--bg-color):** #E4F1FF (rgb(228, 241, 255)) - Use for the body background.
- **Secondary Background (--secondary):** #AED2FF (rgb(174, 210, 255)) - Use for table headers, inactive calendar days, and subtle container backgrounds.
- **Accent / Highlights (--accent):** #9400FF (rgb(148, 0, 255)) - Use for active tabs, selected calendar days, order indicator dots, and primary buttons.
- **Dark / Text / Headers (--primary / --text-dark):** #27005D (rgb(39, 0, 93)) - Use for text, section headings, table text, and hover states.

2. New Home Page Hub Create a new default landing view (<div id="home-section">).

- This page should act as a central hub displaying a welcome title.
- Include a CSS Grid or Flexbox layout featuring three large, visually appealing "Quick Action" cards.
- These cards must act as buttons that trigger the existing switchMainTab() JavaScript function to route the user to: "+ New Booking", "Visual Calendar", and "List & Status".

3. Navigation Updates

- Add a "Home" button to the top <nav> bar.
- Make the "Home" tab the default active view on page load.
- Ensure the JavaScript routing logic smoothly handles transitions between the new Home page and the existing tool views.

]

prompt 10:[Please update my existing single-file HTML/CSS/JS Florist Appointment System to include a new **Analytics Dashboard** view. Ensure the complete code is provided in a single file when finished.

1. New Analytics Dashboard Section Create a new tab and view section (<div id="analytics-section">) that serves as a high-level overview of the shop's performance. Include this in the main navigation menu.

2. Key Performance Indicator (KPI) Cards At the top of the dashboard, create a CSS Grid row of summary cards that dynamically calculate and display "Relevant Details" from the localStorage data:

- **Total Orders:** Count of all appointments.
- **New / Received:** Count of orders with the 'Received' status.
- **In Progress:** Count of orders with 'Preparing' or 'Ready' statuses.
- **Completed:** Count of orders with the 'Completed' status.

3. Data Visualization (Graph)

- Import the **Chart.js CDN** (<script src="https://cdn.jsdelivr.net/npm/chart.js"></script>) in the <head>.
- Add an HTML <canvas> element to the dashboard section.
- Write a JavaScript function that reads the appointments array and renders a Bar Chart or Pie Chart visualizing **Orders by Status**.
- Ensure the chart colors utilize the existing purple/blue hex code palette (#27005D, #9400FF, #AED2FF, #E4F1FF).

4. Dynamic Updating Modify the existing saveData() and status update functions so that whenever a new order is booked or a status is changed, the KPI cards and the Chart.js graph automatically recalculate and re-render to show real-time data.

]

Other AI-Generated Actions or Inputs

- **Uploaded Files:** Provided a UI reference image (image_5b32c0.png) to direct the design of the visual calendar and specific date-indicator styling.
- **Code Completions:** Utilized AI to merge multiple separate components (booking form, calendar UI, dashboard) into a unified Single Page Application logic structure.

Testing Phase Notes

- **Data Persistence:** Verified that form submissions successfully write to localStorage and survive forced browser refreshes.
- **UI Responsiveness:** Tested the SPA navigation function (switchMainTab) to ensure seamless transitions between the booking form, calendar, and dashboard views.
- **State Synchronization:** Confirmed that updating an order status in the dashboard instantly updates the shared state, and adding a new booking dynamically injects visual indicator dots into the calendar view without requiring a page reload.
